

QUALITY PARTS

AUTO SUSPENSION CONTROL ARM

Provide quality products and trustworthy services to global auto parts consumers

COMPANY PROFILE

Hangzhou DUHUI Auto Parts Co., Ltd. was established in 2003 and is located in Xiaoshan District Economic Development Zone, Hangzhou City. The company integrates supply chain development, quality management, warehousing, business operations, and other management capabilities, and is built through an information system to provide customers with one-stop services product solutions.

DUHUI has been focusing on automotive bearings for 20+ years, it mainly produces wheel hub, wheel bearing, release bearing, auto suspension control arm, etc., covering more than 4,000+ auto parts models, including all mainstream models on the market.

QUALITY CONTROL

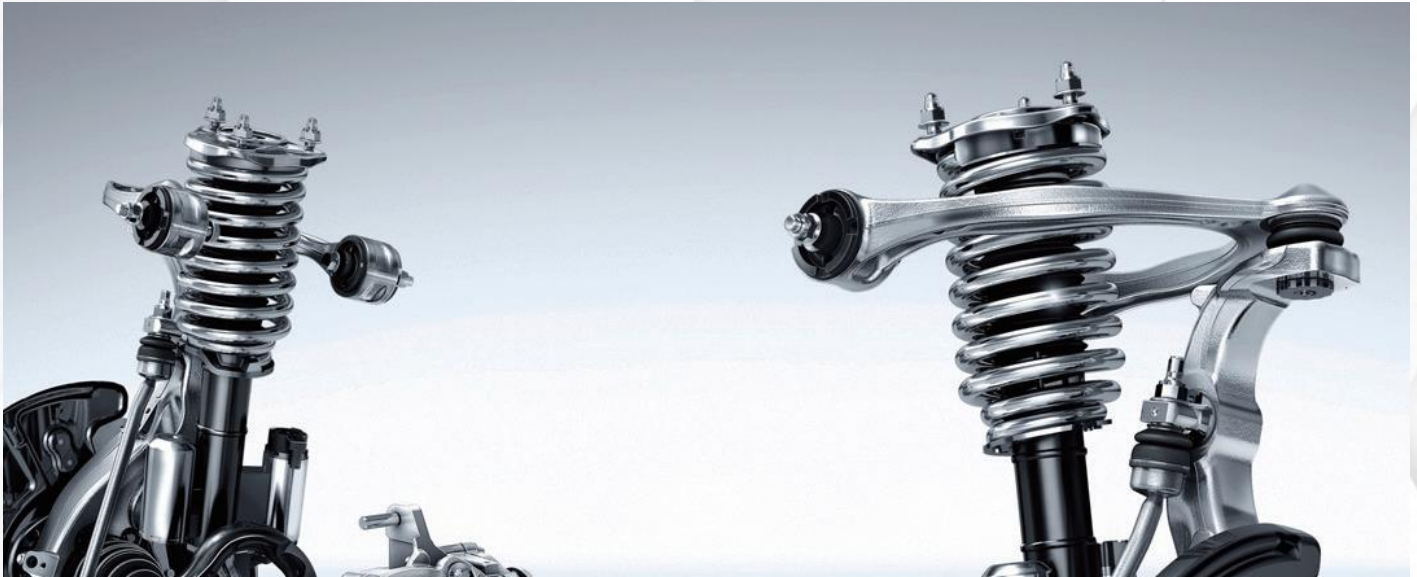

We have installed a complete line of international-advanced production equipments and implemented fabrication technology. The equipments include SIGMA numerically controlled lathe Durability Test Machine, etc.

TESTING CENTER

We installed a complete international-advanced testing and examining equipments to ensure the quality of our products. Our Quality Department strictly test each unit according to ISO/TS standards.

AUTO SUSPENSION CONTROL ARM

The suspension system is an important assembly in modern cars and has a great impact on the car's driving smoothness and handling stability. The control arm (also called the swing arm) serves as the guide and force transmission element of the automobile suspension system. It transmits various forces acting on the wheels to the body while ensuring that the wheels move according to a certain trajectory. The control arms elastically connect the wheels and the body through ball joints or bushings.

Basic structure of control arm

The basic structure of the automobile suspension control arm mainly includes the control arm body and ball joint assembly (bushing assembly).

The control arm body is usually made of aluminum alloy forging. This process makes the control arm body form an integrated structure, which not only improves the structural strength but also reduces the difficulty of manufacturing. One end of the control arm body is provided with a first mounting part, and a first mounting hole is formed in this mounting part. Its main function is to avoid the bushing assembly and ensure that the bushing assembly can be installed in the first mounting part through this mounting hole.

The bushing assembly consists of an inner tube and rubber parts. The inner tube is arranged in the first mounting part through the first mounting hole, and the rubber piece is arranged between the inner tube and the first mounting part and plays a role in fixedly connecting the inner tube and the first mounting part. The inner tube is made by a cold heading process, which improves the production efficiency of the inner tube, ensures its mechanical properties, and reduces production costs.

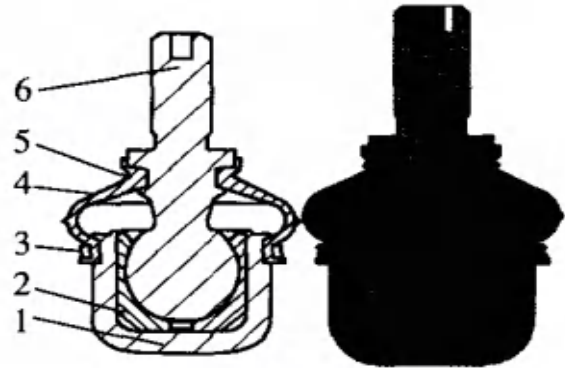

In addition, the control arm may also include other components, such as a ball joint assembly, which consists of a ball seat and a control arm body, which are connected through a specific assembly method to achieve flexible rotation and precise positioning of the control arm during vehicle driving. This design allows the control arms to be adjusted at different angles and directions, ensuring that the contact between the wheels and the ground is always optimal, improving the vehicle's handling and stability.

BALL JOINT ASSEMBLY STRUCTURE

1. Ball joint assembly(ball seat without baffle)

Composition:

- | | |
|----------------|---------------|
| 1. Ball seat | 2. Ball bowl |
| 3&5. Snap ring | 4. Dust cover |
| 6. Ball pin | |

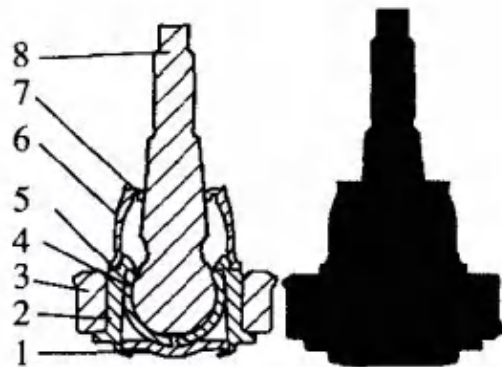

Structural features: The design of this assembly is relatively simple, mainly consisting of a ball head, a ball seat, and a control arm body. The ball seat has no additional baffle structure.

Working principle: The contact between the ball head and the ball seat realizes the functions of rotation and tilt. Since there is no baffle, this design may focus more on lightweight or cost considerations.

2. Ball joint assembly(ball seat embedded baffle)

Composition:

- | | |
|---------------------|---------------|
| 1. Ball seat baffle | 2. Ball seat |
| 3. Control arm body | 4. Ball bowl |
| 5&7. Snap ring | 6. Dust cover |
| 8. Ball pin | |

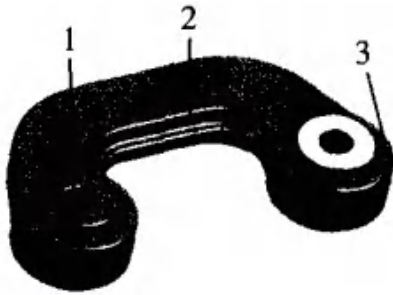

Structural features: In addition to the ball head, ball seat, and control arm body, this assembly has a baffle structure embedded inside the ball seat.

Working principle: The existence of the baffle can increase the stability and strength of the structure, prevent the ball head from coming out of the ball seat in extreme circumstances, and may also help to adjust the friction between the ball head and the ball seat to achieve a better Precise motion control.

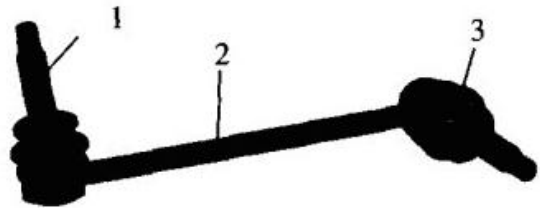

CONTROL ARM BODY TYPE

1. Transverse stabilizer link

The transverse stabilizer link is used symmetrically in the suspension to improve handling stability.

Double ball joint stabilizer bar
(1.3. ball joint assembly, 2. arm body)

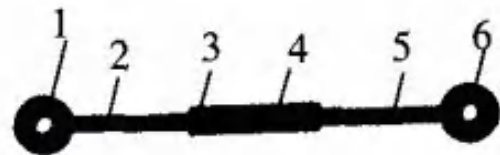

Double ball joint stabilizer bar
(1.3. ball joint assembly, 2. arm body)

2. Tie rod

The tie rod mainly bears lateral loads and guides wheel movement.

Non-adjustable length tie rod
(1.3. Rubber bushing, 2. Steel railing)

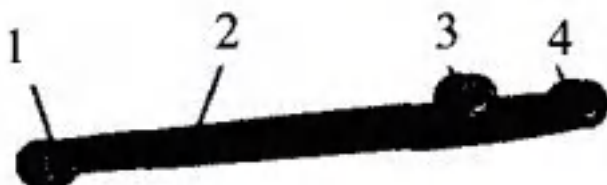

Length-adjustable tie rod
(1. Rubber bushing, 2.5. Threaded tie rod, 3. Nut, 4. Threaded guide bush)

3. Longitudinal tie rod

It is mostly used in drag-type suspension, mainly transmitting traction and braking force.

It helps maintain suspension stability and transmits forces from the wheels.

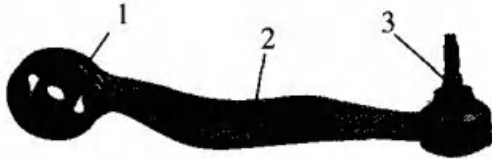

1.3.4. Rubber bushing, 2. Arm body

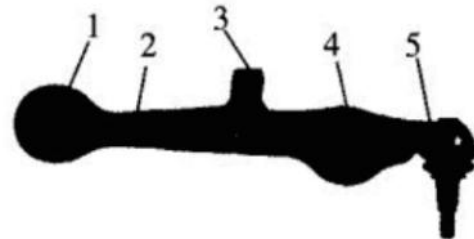

CONTROL ARM BODY TYPE

4. Single control arm

Mostly used in multi-link suspension, two single control arms are used together to transmit the lateral and longitudinal loads from the wheels.

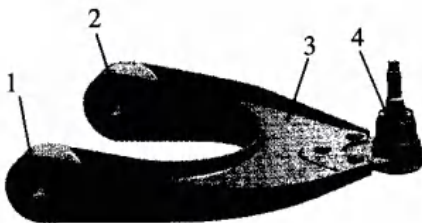

Upper suspension control arm
(1.3. Rubber bushing, 2. Arm body)

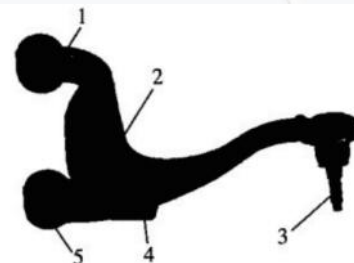

Support arm
(1.4. Rubber bushing, 2. Control arm body, 3. Mounting hole, 5. Ball joint assembly)

5. Fork (V) arm

It is mostly used in the upper and lower arms of double wishbone independent suspension or the lower arm of McPherson suspension. The fork-shaped structure of its arm body mainly transmits lateral loads and plays a key role in the vehicle's handling and stability.

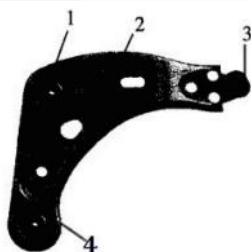

Fork arm 1
(1.2. Rubber bushing, 3. Arm body, 4. Ball joint assembly)

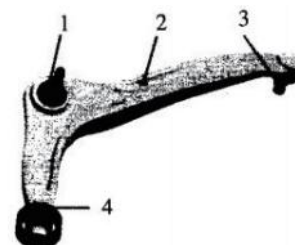

Fork arm 2
(1.5. Rubber bushing, 2. Arm body, 3. Ball joint assembly, 4. Stabilizer rod support)

6. Triangle arm

It is mostly used in the lower arm of the front suspension McPherson suspension to transmit lateral and longitudinal loads and control the relative movement of the wheels and the body.

Double bushing, single ball hinge triangle arm
(1.4. Rubber bushing, 2. Arm body, 3. Ball joint assembly)

Single bushing, double ball hinge triangle arm.
(1.3. Ball joint assembly, 2. Arm body, 4. Rubber bushing)
