

Piezas de calidad

BOMBA DE AGUA

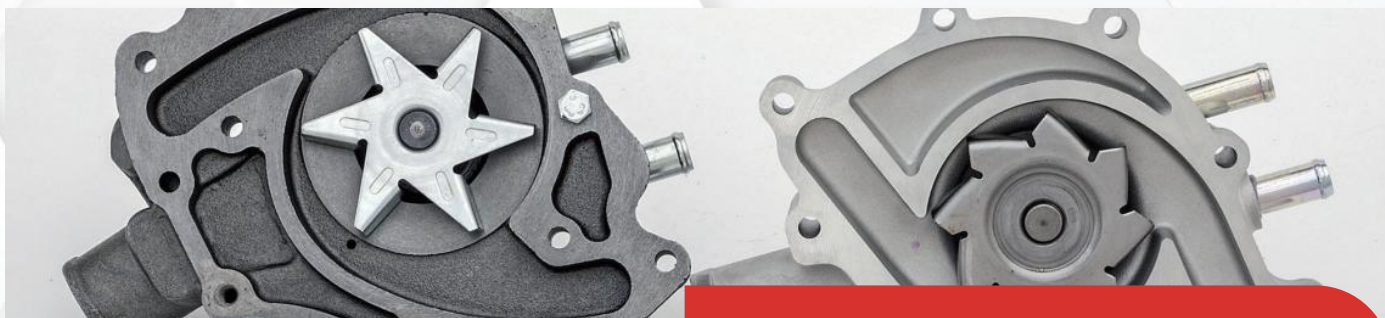

Ofrecer productos de calidad y servicios fiables a los consumidores mundiales de piezas de automóviles

PERFIL DE LA EMPRESA

Hangzhou DUHUI Auto Parts Co., Ltd. se estableció en 2003 y está ubicada en la zona de desarrollo económico del distrito de Xiaoshan, ciudad de Hangzhou. La empresa integra el desarrollo de la cadena de suministro, la gestión de calidad, el almacenamiento, las operaciones comerciales y otras capacidades de gestión, y se construye a través de un sistema de información para proporcionar a los clientes servicios integrales y soluciones de productos.

DUHUI se ha centrado en rodamientos para automóviles durante más de 20 años, produce principalmente maza, rodamientos, collarin, tensor, etc., cubriendo más de 4000 modelos de autopartes, incluidos todos los modelos principales del mercado.

CONTROL DE CALIDAD

Hemos instalado una línea completa de equipos de producción avanzados a nivel internacional y hemos implementado tecnología de fabricación. Los equipos incluyen la máquina de prueba de durabilidad del torno controlado numéricamente SIGMA, etc.

CENTRO DE PRUEBAS

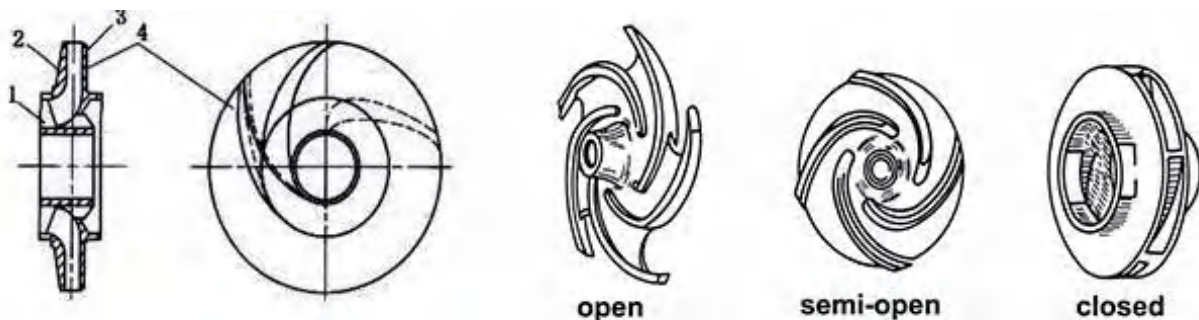

Instalamos equipos completos de prueba y examen internacionales avanzados para garantizar la calidad de nuestros productos. Nuestro departamento de calidad prueba cada máquina siguiendo estrictamente las normas ISO/TS.

ESTRUCTURA BÁSICA

1. Tipo de estructura

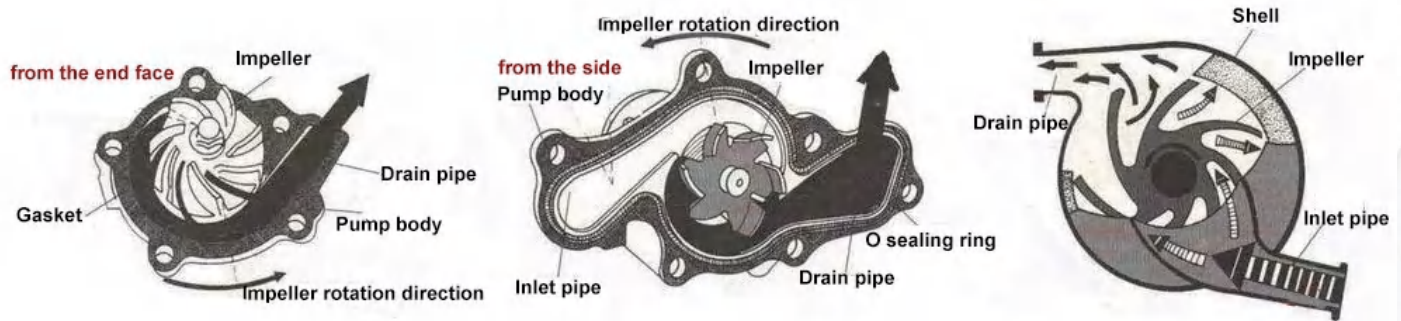

Según los diferentes requisitos de soporte y condiciones de trabajo, las bombas de agua mecánicas para automóviles se pueden dividir en varios tipos, como bombas de agua alternativas, bombas de agua centrífugas y bombas de agua en espiral. Debido a la limitación del tamaño del espacio, normalmente se utiliza una bomba de agua centrífuga que consta de una cámara de entrada de agua, un impulsor y una cámara de salida de agua. Esta estructura tiene las características de tamaño pequeño, peso ligero, gran suministro de agua, estructura simple, etc., y es el tipo de estructura más utilizado.

1-hub, 2-front cover, 3-rear cover, 4-blade

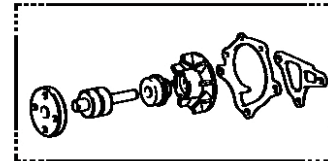

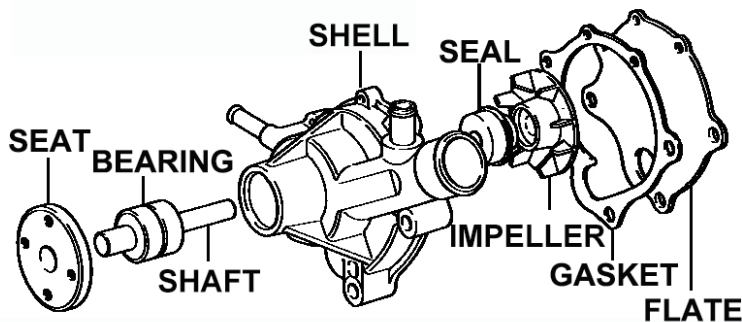

2. 2.Diseño Estructural

Hay muchas piezas alrededor de la bomba de agua de refrigeración del automóvil, y su diseño estructural debe cumplir con los requisitos de diseño general del motor, de modo que la trayectoria del flujo de entrada y salida de la bomba de agua, la forma y sección de la cámara de voluta, el diseño de la entrada y salida de la bomba de agua, la estructura de entrada del impulsor y el tamaño básico, etc., a menudo son difíciles de cumplir con los requisitos de diseño del sistema hidráulico normal, estos afectan directamente la mejora del desempeño operativo, incluida la eficiencia. La estructura de la cámara de entrada de agua de la bomba de agua de refrigeración del automóvil está dividida en forma de cilindro recto o en forma de espiral, y la estructura de la cámara de salida de agua tiene forma de espiral y está integrada con la fundición del motor. Los parámetros geométricos estructurales del impulsor tienen una influencia decisiva en el rendimiento operativo de la bomba de agua. Las bombas de agua de refrigeración de automóviles generalmente adoptan una estructura de impulsor semiabierto sin cubierta frontal.

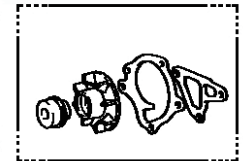

Principio de funcionamiento:

El motor impulsa el cojinete de la bomba de agua y el impulsor para que giren a través de la polea. El refrigerante de la bomba de agua es impulsado por el impulsor para que gire al mismo tiempo. Bajo la acción de la fuerza centrífuga, es arrojado al borde de la carcasa de la bomba de agua. Al mismo tiempo, se genera una cierta presión y luego sale por la salida de agua o la tubería de agua. La presión en el centro del impulsor se reduce porque se expulsa el refrigerante. El refrigerante del radiador es aspirado hacia el impulsor a través de la tubería de agua bajo la diferencia de presión entre la entrada de la bomba de agua y el centro del impulsor, logrando una circulación recíproca del refrigerante.

Pump kit

Impeller kit

Composición básica:

Carcasa: Está conectada al bloque de cilindros del motor a través de sellos y soporta partes móviles como rodamientos.

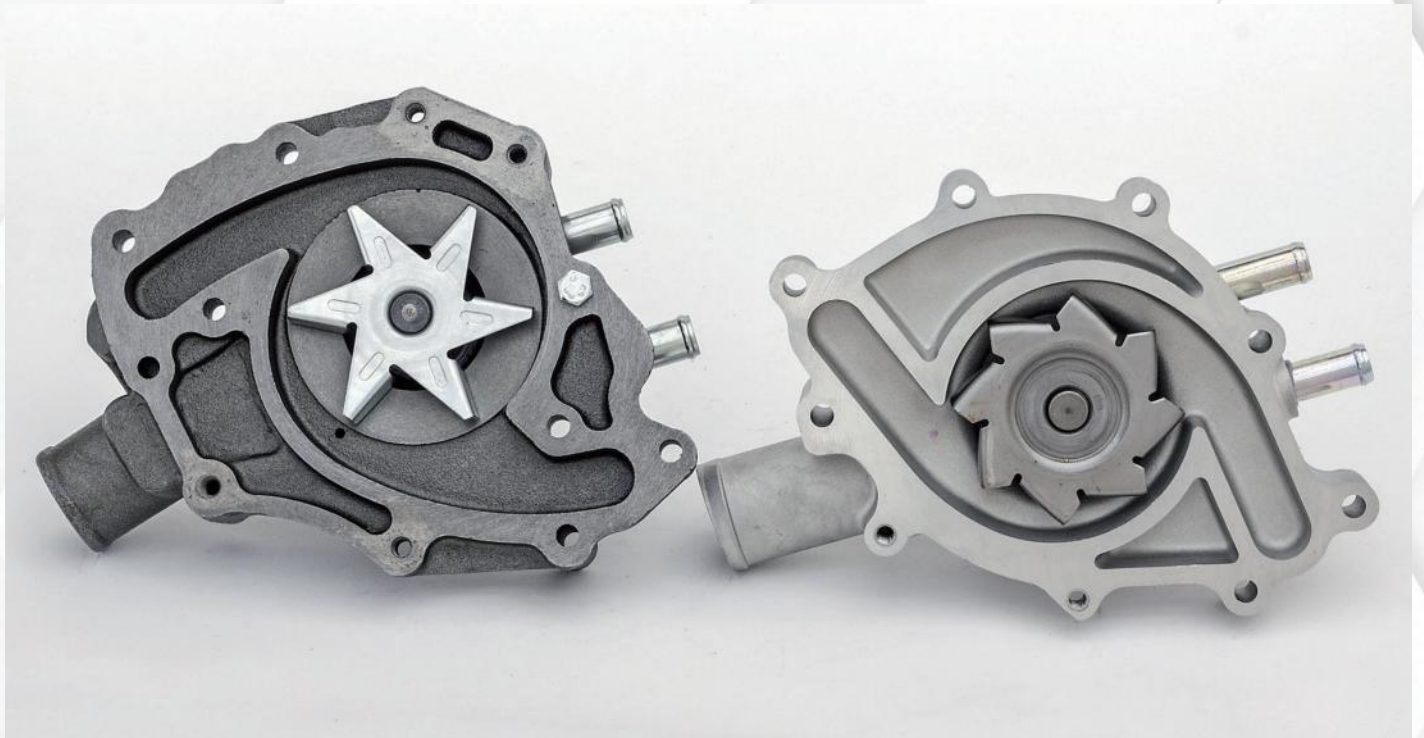

Impulsor: Está compuesto por palas centrípetas radiales lineales o en forma de arco. Utiliza el par de rotación transmitido desde el eje del rodamiento para bombear el refrigerante al sistema de enfriamiento del motor para su circulación.

Rodamiento: Apoya el impulsor y el eje de la bomba de agua para que puedan funcionar suavemente al girar a altas velocidades.

Sello: Ubicado en la conexión entre la carcasa de la bomba de agua y el motor, evita fugas de refrigerante y garantiza el funcionamiento normal de la bomba de agua.

Eje: El componente que conecta el impulsor al sistema de accionamiento de la bomba de agua, generalmente hecho de metal resistente para soportar las fuerzas de rotación del impulsor.

Sistema de transmisión: normalmente impulsado por el cigüeñal o la correa del motor, lo que permite que la bomba de agua gire y bombee refrigerante.

Función

1.Enfriar el motor: La función principal de la bomba de agua del motor de un automóvil es hacer circular refrigerante (generalmente una mezcla de agua y anticongelante) para reducir la temperatura del motor. La bomba de agua garantiza que el motor funcione dentro de su rango de temperatura de funcionamiento normal extrayendo refrigerante de la camisa de agua que rodea el motor y empujándolo hacia el radiador.

2.Proteger el motor: Mantener una temperatura de funcionamiento adecuada es crucial para los motores de los automóviles. La bomba de agua absorbe y disipa el calor generado por el motor mediante la circulación del refrigerante, protegiendo eficazmente el motor contra el sobrecalentamiento y extendiendo su vida útil.

3.Optimice la eficiencia del combustible: Mantener el motor dentro de un rango de temperatura de funcionamiento adecuado puede mejorar la eficiencia de la combustión del combustible, mejorando así la economía de combustible del vehículo. El funcionamiento normal de la bomba de agua ayuda a optimizar el proceso de combustión del motor y reducir el consumo de combustible.

4.Estabilizar el rendimiento del motor: una temperatura demasiado alta o demasiado baja del motor afectará su rendimiento y estabilidad. La función de la bomba de agua es mantener el motor funcionando dentro de un rango de temperatura adecuado, garantizar un rendimiento estable del motor y mejorar la confiabilidad y seguridad del coche.

5. Reducir las emisiones: hacer funcionar el motor a una temperatura adecuada puede controlar más eficazmente las emisiones de escape y reducir la contaminación ambiental. El efecto de enfriamiento de la bomba de agua ayuda a mantener el motor funcionando a una temperatura de funcionamiento óptima, reduciendo así las emisiones nocivas.
