

QUALITY PARTS

STEERING KNUCKLE

Provide quality products and trustworthy services to global auto parts consumers

COMPANY PROFILE

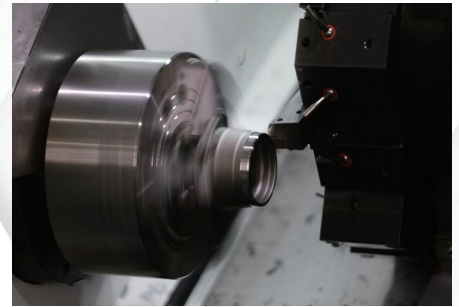

Hangzhou DUHUI Auto Parts Co., Ltd. was established in 2003 and is located in Xiaoshan District-Economic Development Zone, Hangzhou City. The company integrates supply chain development, quality management, warehousing, business operations, and other management capabilities, and is built through an information system to provide customers with one-stop services product solutions.

DUHUI has been focusing on automotive bearings for 20+ years, it mainly produces wheel hub, wheel bearing, release bearing, steering knuckle, etc., covering more than 4,000+ auto parts models, including all mainstream models on the market.

PRODUCTION PROCESS

Duhui is equipped with a professional technical team. We constantly improving production processes and formulating strict process standards while dealing with technical problems, our excellent product quality stems from strict control of process standards.

QUALITY CONTROL

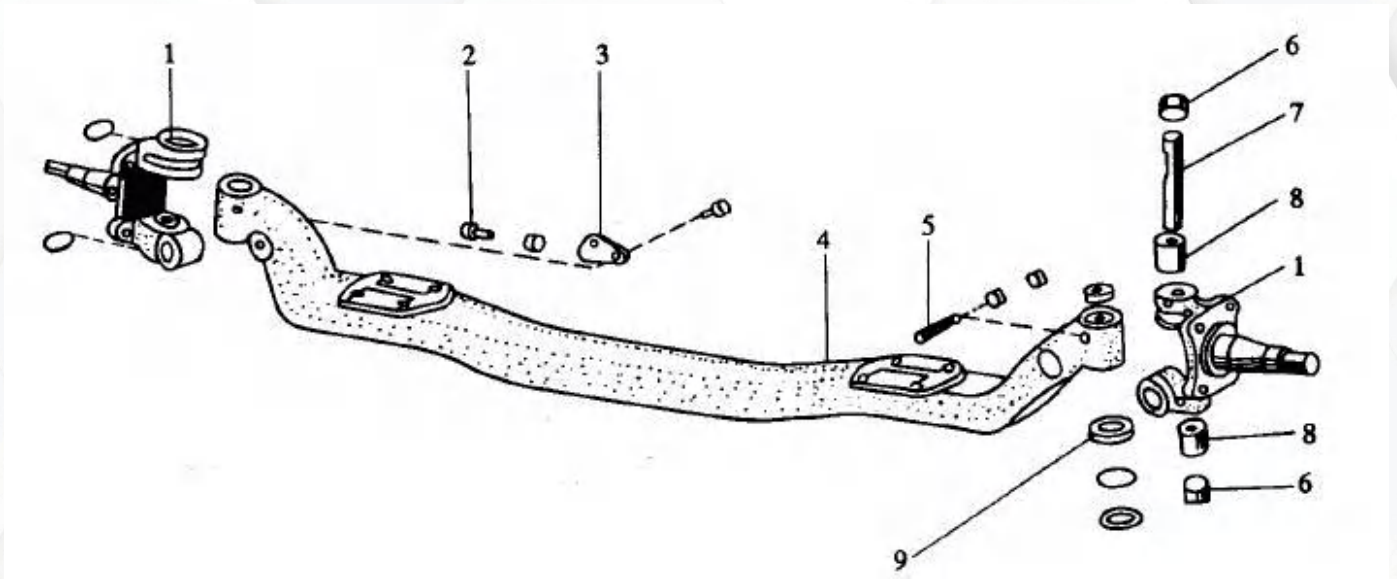

We installed a complete international-advanced testing and examining equipments to ensure the quality of our products. Our Quality Department strictly test each unit according to ISO/TS standards.

STEERING KNUCKLE

The steering knuckle is one of the important parts in the steering axle of the car, which can make the car run stably and transmit the driving direction sensitively.

The function of the steering knuckle is to transmit and bear the load of the front part of the car, support and drive the front wheel to rotate around the kingpin to turn the car. When the car is in motion, it is subjected to variable impact loads, so it is required to have high strength.

The steering knuckle is the hinge for wheel steering, generally in the shape of a fork. The upper and lower forks have two coaxial holes for installing the kingpin, and the steering knuckle journal is used to install the wheel. The two ears of the pin hole on the steering knuckle are connected to the fist-shaped part at both ends of the front axle through the kingpin, so that the front wheel can deflect a certain angle around the kingpin to turn the car. In order to reduce wear, a bronze bushing is pressed into the pin hole of the steering knuckle, and the bushing is lubricated by injecting grease with a nozzle installed on the steering knuckle. In order to make the steering flexible, a bearing is installed between the lower ear of the steering knuckle and the fist-shaped part of the front axle. An adjustment gasket is also installed between the upper ear of the steering knuckle and the fist-shaped part to adjust the gap between them.
